IT SERVICE MANAGEMENT TICKETING CASE STUDY (LAB WORK)

Student : Navroop Kaur
Environment: ITSM College Ticketing tool (Lab Simulation)

1.CHANGE REQUEST : SYSTEM VULNERABILITY REMEDIATION

Overview: A Normal Change Request was created to address security vulnerabilities identified during a system security scan in a simulated enterprise environment.

Change Request Ticket CHR-01153 Snapshot 04-10-2026 11:02:33

Ticket Information

Requested By: Navroop Kaur

Created By: Navroop Kaur

Creation Date: 04-10-2026 10:44 am

Status: Pending Approval

Assigned Service Group: Student

Priority Assessment

Impact: High

Urgency: High

Priority: High

Change Request Description

Change Request Name: System Vulnerability Remediation and patch Update

Change Request Type: Normal

Summary:

This change request is created to address vulnerabilities identified during a system security scan conducted within the PiXELL River Financial environment. The scan revealed multiple vulnerabilities related to outdated services, web servers, and potential security risks that require immediate attention..

IT Guardian
PIXEL RIVER FINANCIAL

Risk Assessment Details

Is recovery available: Yes

Disaster Recovery: In Progress

Change History: Previous change completed successfully

Has testing been completed: Yes

Testing Description: Testing will be performed in a controlled environment before deployment. System updates and patches will be applied and verified to ensure that vulnerabilities are resolved without affecting system performance.

Documented Configuration: Complete/Up to Date

Environment Details

Environment chosen: Production

Environment Risk Factors: None

Install Plan Details

Is there enough time for an install plan: Yes

Installation Description: The implementation will begin by identifying the systems affected by the vulnerabilities based on the scan results. Security patches and updates will then be applied to address the identified issues, including updates to web services and system components. The updates will be deployed using centralized management tools to ensure consistency across systems. After installation, systems will be restarted if required, and verification checks will be performed to confirm successful patching. A follow up vulnerability scan will be conducted to ensure that all identified vulnerabilities have been properly remediated and that the system is secure.

Required employees: 1-3 staff members required

Backout Plan Details

Is there enough time for a backout plan: Yes

Backout Description: If any issue occurs, the system will be restored using system restore points or backups. Updates can be rolled back if they cause system instability.

Backout Plan Difficulty: Medium

Change Request Ticket CHR-01153 Snapshot 04-10-2026 11:02:33

Business Case Details

Start Date: 2026-04-10

Is the change permanent or temporary: The change is permanent.

Business Case Description:

Fixing vulnerabilities is critical for maintaining system security. This change will reduce security risks, prevent potential attacks, and ensure system reliability.

Summary: This exercise demonstrates understanding of ITIL-based Change Management, including risk assessment, deployment planning, and system security patching.

2. INCIDENT TICKET :LOW DISK CAPACITY ALERT

Overview**:**An incident was generated from a Nagios monitoring alert indicating high disk utilization on a Linux-based monitoring server.

Incident Ticket INC-03246 Snapshot 02-21-2026 17:55:57

Record Information

Created by ddd: Navroop Kaur

Incident Ticket INC-03246 Snapshot 02-21-2026 17:55:57

Detailed Description of the Incident

A health check of the Nagios monitoring server identified elevated disk utilization on the Linux host. Although, the system was functioning normally, continued storage growth could impact monitoring reliability and system logging. An incident ticket was created to address the capacity concern proactively and prevent potential service disruption.
